

## **UML Model for HL7 Clinical Document Architecture version 1.0**

S I Herbert, 4<sup>th</sup> May 2001-05-04

Having found the UML model of the Document Body in the document nigh-indigestible, I have remodelled it, correcting a few minor errors en-route. I modelled it from the normative part of the document, apart from the Table-related classes, which are not fully described in it. The diagram has not been checked by anyone else, and may contain errors of mine.

I haven't modelled the header, as that is not directly germane to my ERTAG work.

HL7 CDA v1.0 (OMT Object Model)

 Comment  
 Classes shown in dashed lines have their full context shown elsewhere on this diagram. Cardinalities at the aggregation end of associations are 1 unless otherwise shown. The attributes of a class are only shown once, however many times the class appears. %body attributes comprise:  
 originator: XML\_IDREFS  
 confidentiality: XML\_IDREFS  
 xml\_lang  
 ID: XML\_ID.
